Get a browser & OS compatible website by [Sharewastson](#)

Article published on February 16th 2012 | [Web Design](#)

Conversion services become necessary when you need high-quality website with loads of important features. Favorable websites can be had in any of the available CMS like WordPress, Joomla, Drupal or Magento. Getting a quality website designed and developed will need PSD to HTML conversion service. Such services are easily available in varying price range and a proper research would be needed before availing them. Any HTML conversion service would charge hefty amount if proper research is not carried out. There are different price structure for homepage and inner page creation. The selection of service provider should be done to keep the prices to a minimum possible level.

In PSD to HTML conversion, a design is successfully converted into W3C, CSS and HTML mark up. A quick turnaround time is also available which ranges from as low as 6 hours to 12 hours. If anyone needs even quicker turnaround time, there is a provision of extra charge for such a swift design creation. When the HTML or XHTML markup is ready, a website is designed to suit various CMSs like WordPress, Joomla etc. HTML conversion services star from 50 \$ and touch a staggering 500 \$ limit by many providers. This price often includes whole website design with discount on inner pages.

Many reputed PSD to HTML conversion companies work with a team of competent coders, designers and programmers. The team uses hand-written code as automated coding does not benefit immensely. The codes are validated against W3C so that the resultant website would achieve the target. Coding needs expertise as various important issues are handled. A website which has perfect ratio between the codes, content and file size does always deliver on the promise. When coding is not up to the mark, no website would be able to realize the targets asked of it.

In PSD to HTML conversion, HTML code files are properly checked to enable multiple browser support. The code files are tweaked so that the website opens homogenously and correctly to popular web browsers like IE, Firefox, Chrome, Safari, Opera etc. A website which does not incorporate changes in the coding files never open appropriately and its access remains limited. Easy reach and accessibility are very important for a website to grow and prosper beyond the expectations. A detailed test is also conducted to know the compatibility of the website against operating systems.

Sliced pages of HTML are put to the OS compatibility test against Windows, Linux and Mac. This test is done so that the website works uniform across the available OS platform to fetch good results. The sole purpose of compatibility test in PSD to HTML conversion is to augment the reach and access of the website to more users. From accepting design in various formats to converting it to XHTML/ CSS markup, a conversion process involves a range of steps. If all steps are not done rightly, the website would never ever perform to its optimum potential.

Once the coding and compatibility part is finished, the website is then loaded with content management system to get a good website. Even after that, post delivery support is needed so that the website functions as per the planned coding. A PSD to HTML conversion job is easy when the experience and expertise is available. Manual coding is also important as it ensures that the website would always perform to the potential. If quality website is needed, a proper search is the first step in the right direction. There are many conversion providers available and all claim to provide quality, but only few deliver on those lofty claims.
