Choosing the most effective Eco Lighting by [James Blee](#)

Article published on July 13th 2012 | [Advertising](#)

The range of ECO lighting is growing rapidly as more and more people are looking for environmentally friendly forms of lighting for home and business use. Not only can eco lighting help to look after the environment but many forms will also save users money as they use significantly less power than traditional forms of lighting like incandescent bulbs. LED lighting is one of the most popular styles of eco lighting and there are now many bulbs and light fittings available that are LED. Not only does LED lighting help to reduce energy bills it also uses less CO2. Eco lighting is becoming increasingly popular for commercial use where companies use lots of lights as it can save lots of money and it means they are making a conscious effort to be more environmentally responsible.

Eco lighting and in particular LED lighting gives out no noise, it never flickers, has minimal heat output, is lightweight and extremely durable making it very practical for a wide range of settings. LED lighting products include down lights, spotlights, strip lights, tubes, floodlights, industrial lights, panel, cabinet and decorative lights. There is also a range of eco lighting bulbs for all LED lighting products. Eco lighting doesn't have to mean boring lighting that looks industrial and isn't stylish. Many lighting designers are now creating a range of decorative and modern LED lighting products that look striking and can add a wow factor to any room.

For commercial and industrial use LED lighting is very effective and will offer bright light without noise and flicker which is ideal for offices, warehouses, factories and retail outlets where many lights are needed to provide adequate lighting. Where lights are in use for very long periods of time such as in businesses that operate 24 hours a day like airports and hotels eco lighting will be much more cost effective meaning energy bills will be fraction of the price compared to using traditional floodlights, strip lights or spotlights.
