Common Facts about Oil Changes!

by Rum River

Article published on January 3rd 2012 | Business

Did you know that regularly scheduled oil changes are an important part of preventative vehicle maintenance? Heat is created through the friction caused by the parts of an engine as they work together in constant motion. An oil change keeps the oil and filter clean, so that these critical parts are kept lubricated, cleaned and cooled. Otherwise, the heat generated by that friction can melt the metal components of an engine together.

Why are oil changes so important?

Dust, metallic shavings, condensation, and even antifreeze can contaminate motor oil. Even additives, which break down over time, are also subject to contamination. Just the normal wear and tear of driving generates heat that breaks down the oil so that it no longer effectively protects, cleans, cools, and lubricates the engine. Most manufacturers recommend a regular schedule for oil changes about every 3,000 miles to keep an engine protected from damage. This will help your engine running with greater fuel efficiency and protected from the damage of contaminants.

Is your car becoming difficult to start? Are you starting to hear strange new noises? These may be signs that an oil change is due. An auto mechanic will generally inspect the over-all condition of your vehicle during an oil change service. They can keep you informed of any other auto repairs that may be looming in the near future, recommended at a certain mileage point, or possibly even urgent right now. Having regular oil changes will increase the efficiency of the operation of your vehicle, save you money, and prolong the life of your vehicle.

If youâ€™re looking for reputable and money-saving oil changes, contact our ASE Certified Technicians today for expert advice by calling (763) 389-3811, or go on-line at http://www.rumriverauto.com/ for more information and to find our oil change coupons.
