So youâ€™ve recently purchased an iPod and youâ€™re excited about it. You go to the official website of Apple and download iTunes files, your favorite songs, movies and video clips from it. You play it on your iPod and you find it cool! Now you wish to share it with your friends so you insert a DVD on your systems and try to copy it. Alas, it didnâ€™t get copied isnâ€™t it? Well, the problem is not in your DV burners, DVDs or DVD players. The problem is the file extension of your iTunes files. It is not recognized by normal DVD burners.

So what do you do next? Yes, try to find a solution! Have you ever given it a thought that why doesnâ€™t your file get copied? Well, it is because Apple files come with a special extension that is .M4V which is a modified form of MPEG scripts. This file extension is protected by DRM or Digital Rights Management tag which is similar to a copyright policy. It was specifically created for the Apple Corporation so as to prevent piracy. Thus, these files can be played on Apple devices only.

Now, if youâ€™re wondering whether this DRM protection is legally removable or not, the answer is yes. Simply look for a suitable drm media converter program and accomplish this task.

Basically, a DRM media converter is a 3-in-1 program which performs a 3-step function:

1) When you run it on your systems and load DRM protected files to it, it removes the DEM tag.

2) It converts the file extension .M4V to any other format which is specified by the user, as per his requirements.

3) Also, during the process of conversion, users can edit their files and remove/add/modify or change their contents.

Thus, instead of purchasing 3 different applications and running them for countless hours, why not purchase single software that performs all these tasks?

Although there are plenty of applications available on internet however, since Iâ€™ve used Aimersoft DRM media converter only, Iâ€™m going to discuss about it.

Aimersoft DRM media converter is a wonderful program that can convert all files recognized by your iPhones, iPods and Android tablets. They can change media files into over 50 different HD video, SD audio or simple audio files at 6 time faster speed. The lately introduced version that has been launched in the markets on 29th February 2012 can fix bugs, perform batch conversions and provides the provision of making optimized settings.

All this is available at $39.95 only plus, thereâ€™s a trial version too! Youâ€™d be lucky if you get an additional discount because some sites are running cool offers these days.
