How does one crack WEP (Wired Equivalent Privacy)? Keep this aside. How on earth does one crack WIFI, (Wireless Fidelity) which is by far the most used network in the United States of America? Let me make it very clear that it's absolutely illegal to crack any of the aforementioned without obtaining permission; however, if you're a penetration tester, you'd surely love to learn cracking either of these.

Any network that is wireless is obviously susceptible to hacking and interception, seeing that the data transmission occurs by means of radio wave communication. To prevent this from happening, the data that is sent and received should be encrypted. But still can one crack WEP and crack WiFi attacks? With the help of portable testing tools.

A WiFi network can encounter a lot of threats, flaws and glitches. Speaking of which, one can exercise superior control over such cyber intrusions, by installing a powerful penetrator device or something else of that sort. Designed to facilitate WiFi security, portable penetrators make life easy for penetration testers and other users who like to crack WiFi or crack WEP. Since this unit detects intrusions in a robust manner, it is expected to tip off an administrator that prompt actions be taken immediately to fend off unnecessary upshots of any likely security intrusion.

When you install portable penetrators and add them to your network system, you can find out the current status of your wifi networks and assess how secure they already are. This comes in really handy especially if some attack has already been staged, which increased chances of heavy infestation. To crack Wifi or Crack Wep is not just a mere security audit process after all, the portable penetration tool also provides automated vulnerability testing, besides helping in management and proper allocation of network resources in the event of any attack. In case of complex vulnerabilities, the tool gears up to face off security threats and provides real time reports of network security, thereby letting the administrator know how sooner one can crack WiFi or Crack Wep, to thwart likely upshots of exposure to major malware.

Thanks to its intuitive user interface and intelligent design, the portable penetrator device not only examines the system, scanning all important areas for bugs, threats and malware, but it also zeroes in on the appropriate location from where the threats got into the network. As you would have thought, the tool comes with a detailed bug and threat reporting system which fleshes out occurrences of each and every event that had some significance in changing the network dynamics. More importantly, the tool also enables users to choose from many options/alternatives, which can be adhered to fend off likely threats in future.

Overall, this system does perform well, exceeding expectations, right from the time you start it over till detection of undesirable change in network settings. You cannot find any better tool to be of help, that lets you reinstate network security, especially when you are in a need to crack Wi-Fi or crack WEP, in wake of some undesirable changes in dynamics.
