Smartphones – Bringing smart changes in Communication & Gaming [By](#) [Vadeep Hunka](#)

Article published on March 27th 2012 | [Computer](#)

Smartphones have changed the world by providing the dominance of Internet from desktops and laptops in the palm of our hand. A smartphone can also be considered as a miniature computer that provides access to Internet apart from providing features like GPS, camera, calling, messaging and e-mail facilities. A smartphone has the capability to run multiple applications.

There are various companies providing smartphone mobile like Apple, Android, Windows Mobile, Blackberry and Symbian that provide platforms for usage of smartphones. There are different operating systems on which these smartphones have been built on. Smartphones are mainly being used for internet browsing and social networking. With 2G and 3G speed of the phones, internet speed is much faster and than in any other phones. The users can browse internet, send and receive emails at a very high speed. Now friends are just a text, a whatsapp or a BBM away. It brings the world together and this is exactly what smartphones have done to us; they™ve made our lives easier and helped us keep connected with everyone every time. The surge in smartphone market has given rise to huge demand for development of applications. In recent times, iphone application development and iphone game development services have been the cynosure of smartphone users and smartphone providers alike.

Today, there is an app for everything. One can use the phone™s LED flash like a torch. There™s an app for that. If one needs to have messages read aloud to while driving. Guess what? There is an app for that too. There are apps to read you a book or a magazine that you have just bought via another app. There are apps to give you directions, to find the closest best Chinese restaurant, to keep you updated with the latest news, to know what the weather is like and the list keeps on going on and on. The bottom-line is that smartphones have made life less complicated. The world has become just a touch away. Smartphone technology has opened new vistas and resulted in a whole new career option. The anxiety that one feels while traveling has nearly disappeared. Best of all, one would never look like a tourist anymore because there is an app for that too. The smartphones would never make you lost in the crowd. It is more than Google maps on smartphones that warns you going into wrong directions.

There is no need to get bored while waiting at a slow checkout line or a delayed flight. There are amazing apps and games on a smartphone - be it iphone games, android based games or windows mobile games that would keep you engaged and you would not even know where your time has gone. There are apps that provide context-sensitive offers based on a consumer™s current location, along with results from its database of online merchants.

Smartphones have changed how medical help can be provided. Medical apps are especially helpful in developing countries, where qualified physicians may be miles away. By entering symptoms into a medical application, villagers can have remote access to doctors.

With new inventions everyday, people who are using smartphones are finding a hard time to get away from these devices. With newer and more sophisticated apps everyday, it™s hard to imagine life without them. Smartphones have become a necessary and an integral part of our lives. All in all, there is no field untouched by the smartphones and with the growing of the apps for every age group. In the coming years, it seems that there would be an app for everything extending the convenience factor as much as possible while benefitting the society at large.
