LCD or Plasma: What is Better for You?

by Steve

Article published on April 4th 2012 | Hardware

These days, high definition television sets are varied, both in price and quality of the picture shown. There are two great competitors who struggle to be the best and offer the greatest possible images to the customers.

LCDs (liquid crystal display) are more popular than plasmas because they tend to be cheaper while still providing amazing results. They come in varied sizes, form 19 inches to 80 inches, in the case of LCDs with LED backlight. What are the benefits of LCDs? Well, they still provide astonishing pictures and great details, having decent power consumption. On the other hand, the viewing angle can alter the quality of the image, but this is not very important.

Plasma TVs offer excellent quality for both static and moving images. In addition, they provide a great contrast and quality especially for darker colors, in comparison to LCD which do not display black as well as plasmas do. However, while plasma is a lot more expensive and less energy efficient, it is perhaps the best possible choice for watching movies in your living room. Many people agree that it is slightly superior to LCDs in this regard. Also, the viewing angle does not distort the image.

So, those are only pros and cons for different flat-panel HDTVs. It is up to you and your preferences. Regardless of your choice, you buy a high-quality HDTV which will definitely enhance the quality of your videos and movies.

HD LCDs are very popular and they can be used as TVs or displays for your desktop computer. Their popularity is increasing considerably and they will get cheaper and cheaper over the years. They overtake CRT TVs sales in 2007 and their production has never been decreased. If you plan to buy a HD LCD, then you are making the right decision. You can opt from various brands and technologies, such as LED backlight which is a recent innovation. Also, prices will increase according to your desires regarding the size of your LCD. If you are not sure what to buy, always ask before making the purchase. Inform yourself about the pros and cons of every LCD. If your friends have already bought a LCD, pay them a visit and observe the quality of the image. This may help you decide what kind of LCD you want.

If you want to buy from the Internet, there are a lot of great websites and companies that sell their products online. The great benefit of this is that you will often find product reviews and comparisons which can help you decide what you want to buy. For example, if you have decided upon a certain HD LCD, then you may search for reviews and opinions from previous buyers and how well it works for them. In addition, if you buy online, you do not have to worry about the transportation of your plasma TV or LCD because they will send it directly to your home and you will just pay for it.
