There are various methods for eliminating undesirable skin problems such as acne, facial hair, wrinkles, veins, sunspots and scars among a host of other skin problems. However, one of the most popular solutions for treating wrinkled skin is Botox treatments. These have proven to be the most effective and persistent over long periods. Recent developments in Botox compounds technology have opened up several different methods and applications of Botox based treatments. To undergo a successful Botox procedure, one must know about all the requirements and conditions beforehand. One must be knowing their skin type as it is very necessary since this is essentially a skin treatment procedure. Understanding your skin type helps your doctor or surgeon or the person handling the Botox, to adjust the quantity of Botox dosages such that it is safe for the skin and you as well. For quantity of Botox higher than necessary may lead to extra tightening of the skin as well as restriction of the movement of facial muscles. While lower dosages of Botox will not be effective at removing unwanted wrinkles completely. Therefore, the correct dosages of Botox are very important for best results, which are safe as well. Botox treatments are simple and almost virtually painless. A treatment can take up to 20 minutes, depending on how many injections need to be infused as per previously calculated requirements. These Botox injections are infused between the eyebrows, in or around your crow's feet (near the eyes) and, for furrows in your forehead, which can be treated too. Another different method is to go in for collagen stimulator surgery or procedure, which promotes the body to reconstruct dead skin cells and recreate skin that appears youthful and radiant. A collagen stimulator works by stimulating the production of your own facial collagen, which helps reduce and eliminate lines, wrinkles and folds and replaces fullness to your face, which has been lost by ageing. This collagen stimulator works gradually and gently by providing natural and subtle results, which are visible on the surface of your skin from day one. Once your treatment plan comprising a collagen stimulator has been completed, the subsequent results may last up to 3 years, depending upon the type of skin and all the other environmental factors such as the kind of climate it is exposed to, the frequency with which it is washed and dried, maintained, etc. Usually the results last longer than other types of injectable treatments.

One of the most important things to avoid doing after a Botox surgery is applying any kind of facial creams, ointments, cleansers, bleaching agents, cold creams, lotions, sprays, beauty products such as whiteners, etc. Moreover, the skin must not be exposed to any irritants, harsh chemical agent, gases, extremely harsh or extended durations of sunlight. This will cause the skin to dry up or even peel as the skin after Botox treatment has witnessed a fresh new layer of skin exposed directly to natural elements around us. Therefore, the skin must be carefully and gently moistened and wiped and not rigorously, harshly. Using medicinal cold creams or moisturisers to prevent the skin from drying up, always. Protect the skin from environmental pollutants and hazardous substances.
