Some Common Tools that a Vancouver Carpenter Uses by Linda Wise

Article published on April 30th 2012 | Home Improvement

Quick, think about a carpenter! If youâ€™re like most people in Vancouver, or in the world for that matter, then the first thing that popped into your head is someone wearing a helmet and a tool belt while lugging around a toolbox and a lunchbox. This is the stereotypical image that people have of a carpenter, but has anyone ever really wondered what that toolbox and that tool belt contain?

There would come a time in your life when you want to shake things up a bit at home by doing some renovations or remodeling. When this time comes, youâ€™re going to need to hire carpenters, as well as other professionals, to help you get the work done. Though carpenters are usually called upon to build stuff, their job description also includes artistic ventures such as sculpting wooden frames or making artsy furniture. No matter what kind of work a carpenter is faced with though, there are a couple of tools that are indispensible for his/her trade. Here are some of them.

Hammers. The most common type of hammer that carpenters carry is the claw hammerâ€”one side is for driving nails, and the other side is for pulling them out. There are also other types of hammers that carpenters use for different purposes, like forging, fitting, and breaking. The sledgehammer, another common hammer type, has a flat head connected to a long handle that can deliver massive amount of force.

Measuring Tools. Nobody wants to live in a house that looks like it was designed by Lewis Carrollâ€™s Cheshire Cat from Alice in Wonderland. This is why measuring tools that make sure that everything is aligned and in place are some of the most important implements in carpentry. These include tape measures, yardsticks, rulers, and framing squares.

Sawing Tools. Saws have been around since ancient times and are still considered as some of the most important tools in carpentry. A carpenter Vancouver residents hire would use different types of saws depending on the material or the cut that is needed. A compass saw is used to make curved cuts, for example, while back saws are used for stronger and harder wood.

Fastening Tools. After measuring and cutting the materials, what a professional in carpentry Vancouver has to offer would need to do next is to fasten the materials together. Because of advances in technology, most carpenters use hand tools as well as power tools. These include automatic nail punchers and wood glue.

Donâ€™t forget to make sure that the carpenter Vancouver companies sent to your home to do the work is trustworthy. For more information, you can visit carpentry-pro-framer.com/basic-carpentry-tools.html or moah.org/exhibits/archives/tools/carpenter_tools.html.
