Summer Troubles: All About Pests and Eliminating Them from Your Home by [Maxcowman](#)

Article published on August 21st 2012 | [Home Improvement](#)

Summertime has shown up, and people in the United States are literally taking the heat. Portions of the U.S.A. continue to struggle with the intense heat that has already claimed a number of lives and hampered food production for the season. Yet, what you might have to stress over is something closer to home: it's also pest season.

The National Pest Management Association (NPMA) alerted that the extreme heat is generating optimal conditions for bugs to flourish. The National Oceanic and Atmospheric Administration say the very first half of 2012 has been the hottest since 1895. The exceptionally warm weather produces the ideal conditions for fleas, ants, termites, and various other insects to multiply in addition to pest issues. What makes warm weather favorable for these pests?

Cold-blooded critters

Experts say a lot of pests are cold-blooded, indicating they get their heat from outside sources like the sun (they are also known as ectotherms). Daniel Potter, professor of entomology at the University of Kentucky, states that their cold-blooded physiology permits them to become active and survive in the warm weather condition. Meanwhile, the NPMA could not agree more.

This is especially the circumstance with insects with numerous broods like ants and caterpillars. The warm climate assists to them grow in number, creating big accumulations of bugs where you least expect them. As regions like Fort Worth are suffering from the dry spell, NPMA proposes calling an exterminator Fort Worth can offer for urgent pest control.

Seeking shelter indoors

Some pests might not prefer the scorching weather and might be compelled to nestle in cooler areas like your attic or foundation. The NPMA cautions that homeowners may encounter more bugs than the typical number over the timeframe of the intense heat season. However, several suggest that global warming may expedite the bug complication. Professional pest control Fort Worth can provide can be your best possibility at defending against the horde from invading your home.

If you wish to find out more about exactly how scorching weather can affect bugs, go to the official website of the NPMA at PestWorld.org. Don't await the critters to grow; or else, it might be too late to do anything about them. Contact a pest control professional the moment indications of infestation manifest for effective Fort Worth termite control and the prevention of development of many other insects.
