The Wild World Called Internet and How to Go shopping for One by [Nathan Brown T](#)

Article published on February 2nd 2012 | [Internet](#)

There are scores of offers for internet services these days, so many that when you actually begin your endeavor to buy one for your home it can leave perplexed and confused. That is because the claims will all be the same and without an exemption one will try to outdo the other in their strong marketing pitch. The best defense against getting carried away by clever sales talk is to do your homework well in advance and ask yourself the appropriate question before you zero in on the right connection.

Amongst the top pitch sales talk can be without doubt, the internet speed that companies promise, how to pay your bills, whom to contact for complaint redressing complaints so on and so forth endlessly. However an internet connection like the AT&T U-verse Internet for your home is a basic necessity that you cannot forego even if you find that none of the offers from the scores of internet companies fit your bill. So ultimately it is all going back to square one.

That is not reason enough to throw your hands up in despair; get a little tech savvy, try to understand the gimmicks behind marketing and finally understand the jargons of the trade and you will feel like a professional out in the wild to clinch the best deal that your money can buy. As said earlier, promised speed is the most frequently flouted point in favor of an operators marketing sales pitch, so understand them better. And that should equip you with all the tools to make a wise choice of your internet company.

When you are out in the wilderness, the first jargon you will encounter is a word called "bandwidth," be vary about how you understand it. Bandwidth for some can mean the speed at which data will flow through the copper or optic fiber cable to your computer, but when in the context when you buy space on web server can mean the amount of data that users can download. The usual way to measure bandwidth when uploading/download is Megabytes per second, better known as Mbps; and in the context of web server can mean the total download.

When Mb is used in the context of speed it means the amount of maximum data that will stream to your computer, but then there is a hitch; it can also mean that this capacity is not exclusive to you. If you need to understand it better it simply means that the gate that controls the flow of data is capable of handling the promised speed, but the rider is you will be sharing it with a lot of internet users like you.

Internet companies aggregate the total speed to all their users based on the presumption that not everyone will be using their service at full throttle all the while. It is indeed true that not all users can be using at the same time, but chances are that the more the average assumption made by the company can go wrong at peak hours and you may experience a slow down. So as the company how well they connect to the internet backbone and what their cable network is capable of carrying.

Another frequently user word in the world of internet service is "unlimited usage." Understand that it not unlimited in its real sense as you would use it grammatically.

For most operators it means a "fair usage" policy. What is fair usage in the context when applied to unlimited uploads and downloads is a matter you need to check it with the operator. Sometime it can mean a condition in which only a certain quantity of data will be allowed for a fee and in the event your usage is higher, the speed will fall dramatically, so much so that you feel like your connection is a dial up connection. Check the facts before you take the final plunge to sign up with an operator.
