Article published on February 27th 2012 | Software

Windows system has many issues and problems and all these issues affect your systemâ€™s speed and performance in anyway. The BSOD or blue screen of death is one of the most common and serious issue in almost all the Windows systems. The BSOD can affect your computer system in many ways and subsequently your PC gets affected severely and you might experience PC freezing, Slow PC and many similar issues due to this PC error.

A BSOD or Blue Screen of Death indicates that something has gone wrong within your system, technically called a STOP error, occurs when Windows suffers a serious error and is forced to "stop" completely.

The BSOD error gives you no choice but to restart, troubleshooting one can be difficult. Luckily, almost every STOP error includes a STOP code that can be used to research a fix.

The blue screen can be occurred due to many reasons and causes many issues including unexpected shutdown, PC freezing, slow PC, slow startup and many more.

Some of the important factors that can cause the BSOD or blue screen of death are as follows:

Any Hardware fault, failure

A faulty hardware component or any broken or damaged piece of hardware can cause the BSOD error in your computer system. Also if any of the hardware is not compatible with your system it can also cause this PC error. The best and only solution to fix this PC error (BSOD) is to replace the affected hardware piece.

Memory or Random access memory issue

RAM or random access memory can also cause this issue often. If you are using a corrupt RAM it certainly can produce the Blue screen PC error and consequently more system related issues. Replace the damaged or broken RAM with a fresh and working RAM is the only solution for this.

Corrupt device drivers

Corrupt, outdated and incompatible device drivers can also cause the blue screen of death PC error. Verify the problem and remove and reinstall the fresh and latest drivers directly from the manufacturerâ€™s website.

Corrupt Windows registry

The Windows registry is one of the most common and essential components in any Windows Operating system. If it is corrupt by any means it is capable to produce many system and performance related issues including this BSOD error message as well.

To overcome this issue you must clean and repair all the registry problems and make it error free. For this purpose you can take a help from a reliable registry cleaner program which would be capable to clean all such registry problems and other PC errors.

A specific software program if it is corrupt can also bring this PC error in notice

Apart from all the aforementioned BSOD causing factors if any particular software program is not working and if it is corrupt, damaged (especially the security software) so it can cause the BSOD error in your PC.

If you find any program is causing this issue you must remove and reinstall the program from your computer so that it can be error free.
