Article published on July 13th 2012 | VOIP

With the progressive implementation of VoIP technology and telephony platforms across the market place, VoIP telecoms are easily available with offers of great telephony services and integration of mobile phones into any current VoIP system. This action caters to the effective call forwarding to remote workers to boost business operations and bottom line.

Hence, it is common then to have VoIP telephony companies offering the most adaptable telecom system on earth with a wide range of diversity.

Government Investment

It is not surprising to have even the government coming onto the scene with a large investment into VoIP telephony. As much as Â£100 million has been considered to be invested into high-speed broadband infrastructure across the nation in big cities to kick start the new wave of telecommunications. Good connectivity is crucial to achieve high quality VoIP calls which is welcomed by businesses.

Big cities in UK such as London, Cardiff, Edinburgh and Belfast would be some of the lucky recipients of the million-dollar investment which would generate more efficient and quality VoIP telecoms to service these citiesâ€™ businesses and consumers.

Local city councils would bid for the state investment funds with resources targeted at locations which British Telecom and Virgin Media are not servicing. Hence, more districts would enjoy high-speed internet and VoIP services.

Business companies or telcos can also benefit from this investment allocation by applying for a subsidy. They would need to showcase their business telephony platform plans and proposal with possible matched funding by the government. They would enjoy high broadband speeds between 80Mbps and 100Mbps in strategic employment industries and zones.

Telecom solutions

Thus, many innovative telecoms are restructuring and re-trained to be qualified VoIP telecoms. The proper license is required to offer the comprehensive suite of telecommunications solutions which encompass corporate voice solutions, PBX options, data access, ISP services, video conferencing services, SMART Board and telephony management systems. Other telephony solution choices include corporate faxing, remote security monitoring and text messaging applications.

Telecommunications using VoIP has many advanced features that strategically position the business to leverage on possible future opportunities in whatever environment. This new technology combines cost minimization and efficient service to its users.

Features

VoIP telecoms offer many features that would boost the bottom line of businesses; the wide selection of corporate data and voice solutions include alternative voice provision through VoIP/Neotel/GSM connectivity or through cellular calls, local calls, national calls, international calls, regional calls, inbound calls and Inter-branch calls as well as Inter-Community calls.
